TITLE: The wear of cermet and ceramic sintered carbides during the cutting of hot rolled material

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 6, 1961, 31, abstract 6B221 (Tr. Gruz. politekhn. in-t., Shromsci, 1959, no. 3 [64], 155-165, Georgian summary) ✓

TEXT: The authors comment on the low life of steel disk saws during the cutting of hot rolled material. To search expedient cutting materials, the sintered carbide grades T15K6, T60K6, T94N1Fe6, HT2 (NE2), the mineral-ceramic UM332 (TsM332) alloy and the German mineral-cermet C40 (S40) alloy were investigated. The authors present comparative durability tests of the materials under investigation during continuous (turning) and non-continuous (milling) cutting. The life indices of the cutting materials were rated by the results of the cutting tool wear. Based on the test data it was found that the T15K6 sintered carbide is a suitable material for the cutting of hot rolled material, although the NE2 grade sintered carbide has some prospects for the cutting of hot

AUTHOR: Tsotskhadze, V. V. (Candidate of technical sciences, Docent)

TITLE: Cutting temperature in turning preheated metal

SOURCE: Vestnik mashinostroyeniya, no. 11, 1963, 51-53

TOPIC TAGS: hot machining, cutting temperature, cutting temperature measurement, heat resistant alloy machining, hot machining rate, metal cutting, heat resistant alloy, alloy machining, machining rate

ABSTRACT: The contact temperature during cutting of preheated steel 45 and alloy EI617 for different cutting conditions was investigated on the device shown in Fig. 1 on the Enclosure. The extension (2) of the test piece (1) serves as the cold junction of the working piece-cutting tool thermocouple (4 and 8). The tail stock (3) and spindle (6) are insulated from the rest of the machine by insulation (7), (8 is a slip-ring). Curves of surface temperature (measured with a platinum-platinum-rhodium thermocouple) as a function of cutting speed (5-80 m/min) for different initial temperatures (20-930C) were obtained for steel 45 and alloy EI617 with a cutter made from TSK10 alloy. For steel 45 the temperature increased from 900-1200C as velocity increased from 5-80 m/min (920C initial temperature) and Card 1/2

ACCESSION NR: AP4000983

from 650-900C as velocity increased from 30-80 m/min (20C initial temperature). For alloy EI617 the curves were slightly higher. The relationship could be expressed as $\theta_{rg} = \theta_{rh} + \theta(1-m)$; where θ_{rg} = contact temperature, θ_{rh} = surface temperature without preheat, θ_n = preheat temperature and m depends upon the material (m = 0.635 for steel 45, m = 0.57 for alloy EI617). distortion attenuation 7 nepers); attenuator pads (from 0 to 15.21 nepers, 150 or 600 ohms characteristic impedance, frequency range 0 to 2 mc/s). There is also, besides the above, a portable measuring set for the frequency band 0.3 - 550 kc/s, consisting of a 12XI035 generator and of a level indicator 12XN042 with a measurement range -7-+2.5 nepers within the frequency band 0.3 - 550 kc/s or of a selective indicator for the frequency band 10- 550 kc/s and measurement range -10-+2.5 nepers. Apart from basic measurements the set may be used for measuring impedances from 50 ohms to 10 kilohms, with direct visual pointer readings. The following items are also manufactured: Resolved components bridge for 50 c/s to 0.5 mc/s range; interference voltage measuring set 12XN031; non-linear distortion meter for the frequency range 100 c/s - 20 kc/s, etc. A special oscilloscope is produced for visual observation of frequency responses within either the 20 c/s - 20 kc/s (either linear or logarithmic scale) or the 0.2 - 6 kc/s band (logarithmic scale). For telegraphy measurements a special 12XX038 stroboscopic distortion meter is being produced (rectangular pulses with mark-to-space ratio 1:1, 1:6, 6:1, 2:2 speed 40 to 60 bands); relative

TITLE: Some crystallochemical and physical properties of single barium titanate crystals with addition of cobalt

SOURCE: Kristallografiya, v. 9, no. 1, 1964, 113-115

TOPIC TAGS: barium titanate, cobalt doped barium titanate, physical properties, absorption spectrum, dielectric constant, ceramics, V color center

ABSTRACT: Chemical analysis has shown that Co ions replace Ti ions in the BaTiO_3 lattice and that for the most part they occur in bivalent form. A peak of 0.52 microns was observed on the absorption spectrum. This belongs either to a V color center or to a Co ion with higher valence. The introduction of Co ions into the BaTiO_3 lattice leads to displacement of the absorption edge. It also very strongly affects phase transitions in BaTiO_3 . It is impossible to inject the large quantities of Co into BaTiO_3 ceramic material that are injected into single crystals. This difference in behavior may be explained by the presence of F ions in the single crystals. The authors' measurements on the physical

Complex chemical study of the roots of *Forula pseudopiceum* Lipshy. I. P. Tsukeravich, V. P. Bruminski, S. V. Burtseva and B. I. Alshkevich. *Russ. Acad. Sci. Chem. USSR* 1935, No. 21, 43-44; *Chem. & Ind. USSR* 37, 882. One ton of air-dry *Forula pseudopiceum* roots can yield 35 kg. of essential oil, 125 kg. of resin and 70 l. of alc. (from the residual carbohydrates). The oil contains about 40% of α -pinene, about 5% of β -pinene, and a small quantity of cuminaldehyde and of sesquiterpenes. Its compn. therefore approaches that of good-quality spirit of turpentine. The resin contains 6.1% of acid-reacting substances, 91.5% of phenols and 20.6% of neutral constituents. The neutral fraction is allowed to stand and there seps. out an ester of the formula $C_{11}H_{14}O_2$. The resin is not suitable for paint manuf. on account of its high volatility and low softening point, its phenolic fraction, particularly after esterification, has an appreciably higher softening point (58°), which approaches that required for paint resins. TITLE: Regulation of coronary blood circulation 22

SOURCE: Fiziologicheskii zhurnal SSSR, v. 51, no. 4, 1965, 495-500

TOPIC TAGS: blood circulation, dog, reflex activity, cardiovascular system

ABSTRACT: The relations between the tonus of coronary blood vessels and those of vessels of the large circle of blood circulation were studied on dogs anesthetized with nitrous oxide. The vascular flow resistance was measured in order to take into account the tonus of arterioles as well as of major blood vessels. There was an inverse relation between the flow resistance in the coronary cycle and that in the peripheral part of the large cycle -- i.e., the tonus of coronary vessels was low while that of vessels in the large cycle was high and vice versa. As indicated by the O₂ requirements of the myocardium of the left ventricle, there was no uniform correlation between the load on the myocardium and the tonus of coronary vessels. However, there was a direct relation between the index of efficiency

Card 1/2

UDC: 612.172.1

L 29368-66

ACC NR: AP6019803

of the left ventricle (i.e., of the efficiency with which O₂ was utilized in it) and the flow resistance in the coronary cycle. When the tonus of vessels in the large cycle increased, the tonus in the coronary cycle was reduced by reflex action in order to supply more O₂ to the myocardium working at an increased load. At a reduced tonus in the large cycle and an increased tonus of coronary blood vessels the efficiency index of the myocardium increased because of the functioning of a regulatory mechanism without which hypoxia of the myocardium could have resulted because of the reduction in the lumen of the coronary vessels. The effect of...

authors are compared. The size of the amplitude of the cycle at the fatigue limit decreases somewhat with the increasing of the size of the mean stress. The superposition of a constant tensile stress σ_s 20 kg/mm² on a symmetric cycle under conditions of a uniform stressed state decreases the endurance limit of St 35, which is determined from a symmetric cycle at a non-uniform stressed state, by about 45%; at $\sigma_s = 4$ kg/mm² - by about 27%. AUTHOR: Tsoy, P.I. (Tula)

TITLE: The diffraction of (short) sound waves with respect to an obstacle (cylinder, sphere, cone and plane)

PERIODICAL: Prikladnaya matematika i mekhanika, v. 25, no. 2, 1961, 365 - 369

TEXT: The author uses the method of H. Poincaré (Ref. 1: Sur la diffraction des ondes hertziennes. Rendiconti der Circclo Matematico di Palermo, t. 29, 1910; 3 Oeuvres, t. X, p. 94-203. Gauthier-Villars, Paris, 1954) to obtain a solution to the problem. From the theory of sound it is known that for a harmonic function the velocity potential of sound waves Φ satisfies the Poisson condition

$$\Delta \Phi + k^2 \Phi = 0 \quad (k = \frac{\sigma}{c} = \frac{2\pi}{\lambda}), \quad (1.1)$$

with the boundary conditions on the surface Σ of the obstacle

Card 1/6

The diffraction of (short) ...

S/040/61/025/002/018/022
D201/D302

$$\partial \Phi / \partial n = 0, \quad (1.2)$$

where c is the velocity of sound, λ is the wavelength and n is the inward normal to Σ . The solution is of the form

$$\Phi = \frac{e^{-ikr'}}{r'} + f, \quad (1.3)$$

where the first term represents the velocity potential of a spherical wave radiating from the origin E , r' is the distance of the point M from E , and the second term is the function of the disturbance produced by the waves reflected from Σ . f is given by

$$f = \iint_{\Sigma} \rho \frac{e^{-ikR}}{R} d\sigma. \quad (1.4)$$

Consideration of the conditions on the surface gives

$$\rho = \frac{1 + ikr}{2\pi r^2} e^{-ikr} \cos \psi + \frac{1}{2\pi} \iint_{\Sigma} \rho \frac{1 + ikR'}{R'^2} \frac{\partial R'}{\partial n} e^{-ikR'} d\sigma, \quad (1.6)$$

The diffraction of (short) ...

where ρ is the density due to the potential of the reflected wave on Σ , and R is the distance between the arbitrary point of Σ and the point M at which the velocity potential is Φ , r is the distance of E from a fixed point of Σ , and R' is the distance between the fixed point and a variable point of Σ , and ψ is the angle between r and the interior normal to Σ . In the case of a cylindrical obstacle the double integral of (1.6) is obtained in the form

$$\begin{aligned} \iint_{(\Sigma)} \rho \frac{1 + ikR'}{R'^2} \frac{\partial R'}{\partial n} e^{-ikR'} d\sigma &= \iint_{(C)} \rho \frac{1 + ikR'}{R'^2} \frac{\partial R'}{\partial n} e^{-ikR'} d\sigma = \\ &= \iint_{(C)} \frac{1 + ikr}{2\pi r^2} \frac{1 + ikR'}{R'^2} \cos \psi \frac{\partial R'}{\partial n} e^{-ik(R'+r')} d\sigma = \\ &= \iint_{(C)} \frac{1 + ikr}{2\pi r^2} \frac{1 + ikR'}{\sqrt{4a^2 - R'^2 \sin^2 \theta}} e^{-ik(R'+r')} \cos \psi \sin^2 \theta dR' d\theta \end{aligned} \quad (2.3)$$

where C is the part of the surface near to E , $\Sigma - C$ is the part of the surface distant from E (Fig. 3) and

$$\rho = \frac{1 + ikr}{2\pi r^2} e^{-ikr} \cos \psi \quad \text{on } C \quad (2.1)$$

AUTHOR: Tsoy, P. I.

TITLE: Discontinuity of the normal derivative of the potential of a single acoustic layer

PERIODICAL: Referativnyy zhurnal, Fizika, no. 8, 1962, 33, abstract 86292
("Nauchn. tr. Tul'sk. gorn. in-t", 1961, collection 3, 86 - 91) ✓

TEXT: For solving the equation $\Delta U + k^2 U = 0$, the potential of a single acoustic layer is introduced by the formula: $V = \iint \rho \frac{e^{-ikr}}{r} d\sigma$. The normal derivative of this potential is determined, and it is shown that in a transition through the surface Σ it undergoes a discontinuity amounting to $2\pi\rho$.
